### **08.04 Discussion**

Now that global warming has become a big issue in the world today, computer modeling has become more important and vital in helping reduce this issue. Computer modeling is a great way to help spread the idea of global warming and put an emphasis on it. In Japan, although many have noticed negative effects as a result to global warmings, such as the fall in quality of rice and experiencing more heavy rainstorms, their contribution towards trying to reduce the emissions have been slow. However, many car companies have now been turning their attention to this issue and are now using technology to build hybrid cars that emit less emission. Because of technology, such as the weather cast, which has become more accurate these days, we are now more aware of our world and how much damage we are causing. I think that as technology advances, we will have many more ways to reduce our damage on earth and make the earth a much safer place.

I agree that computer modeling will be a great solution to this issue. I hope that as technology advances, we will be able to find more solutions to decrease the emissions we emit and make the earth a better place! I also hope that with the help of technology, we will be able to spread this issue and show people how much a threat global warming is!

It is great that California has found ideas to deal with the global warming occurring right now! I also think that computers have definitely helped us understand our world and how much of a threat we are imposing on it.
